High-Value Crop Selection: Factors Guiding Indian Farmers

Free · Share

High-Value Crop Selection: Factors Guiding Indian Farmers

A farmer has two hectares and one borewell. Wheat is safe and familiar. Tomatoes may pay far more. But tomatoes need more water, more labour and fast trucks. If the trucks are late, the fruit rots. High-value crops can earn more than staple grains, but they cost more to grow and carry more market risk.

Horticulture gave 30.4% of agricultural GDP from 13.08% of cropped area in 2018-19. It overtook foodgrain output in 2012-13. MSP covers 22 mandated crops, mostly staples. Most fruits and vegetables have no MSP.

At a Glance

Four facts to hold on to.

01
30.4%

Of farm output value (2018-19).

02
13.08%

Of cropped area (2018-19).

03
2012-13

Horticulture output first exceeded foodgrain output.

04
22

Crops with MSP, mostly staples.

High-value crop Fruits, vegetables, flowers, spices and medicinal plants grown for sale.
Cold chain Keeps produce cool from farm to buyer.
Distress saleA forced quick sale at a low price after harvest.
Agro-ecology Matching farming to local soil, water and climate.

Chapter 1: Crop Returns and Farm Suitability

Must Know

What high-value crops are

- High-value crops include fruits, vegetables, flowers, spices and medicinal plants grown for market sale.
- They usually sell for more per kilogram than staple grains such as wheat and rice.
- They also need more labour, more water and more purchased inputs than most cereals.
- In 2018–19, horticulture gave 30.4% of agricultural GDP while using 13.08% of cropped area.
- Horticulture output first exceeded foodgrain output in 2012–13.
- A high-value label does not promise a higher profit on every farm.
- For the broader story, read The Golden Revolution: Horticulture and Honey in India.

A farmer compares wheat and tomatoes

- Take a farmer with two hectares and one working borewell.
- She can grow wheat with low risk and a well-known local market.
- Or she can grow tomatoes and sell the fresh fruit to nearby towns.
- Tomatoes may pay more. But they need more water, more labour and fast transport.
- If the trucks are late, the fruit spoils and her income falls sharply.
- A high market price alone does not promise a profit.

Why a high price is not assured profit

- Profit equals the price the farmer receives minus the total cost of growing and selling.
- A high market price can still end in a loss.

- Costs rise when seeds, fertiliser, pesticide, labour and packaging cost more than expected.
- A bumper harvest can pull the market price down very fast.
- Not every high-value crop earns more than cereals in every season.
- Some fail badly in a bad year and repay nothing.
- A crop earns more only when its price, costs and market access all work together.

Soil, water and climate

- Every crop needs a matching soil, a suitable rainfall range and a suitable temperature range.
- Most high-value crops need assured irrigation through the whole season, not just at planting.
- Drip irrigation delivers water drop by drop to the base of each plant. It saves water on farms where water is scarce.
- Agro-ecology means matching the farming system to local soil, water and climate.
- Crop plans should fit each region’s soil, water, climate and local demand, not market fashion.

Expected return against input costs

- Farmers compare the likely return with the money they must spend before harvest.
- Input costs include seeds or seedlings, fertiliser, pesticide, labour, and staking for vines.
- Harvesting, grading, packaging and transport add more cost after the crop is ready.
- A crop with a high price but a huge cost can leave a thin margin.

- Farmers with little cash often prefer crops with lower upfront costs and lower risk.

> **Quick check 1.** A high market price for a crop always means the farmer will earn a profit. *(True or False?)* See answer ↓

Chapter 2: Markets, Costs and Farm Infrastructure

Good to Know

Price and demand

- Demand from families, hotels, food processors and exporters sets the market price.
- Demand can change fast within a single season, sometimes within weeks.
- A farmer who checks demand before planting takes less price risk at harvest.

Distance and transport

- The distance to a town or mandi decides how easily produce sells.
- A mandi is a regulated market yard where farmers bring produce for sale.
- Good roads and nearby buyers cut both transport cost and travel time.
- The National Agriculture Market (e-NAM) portal links participating markets online across India.
- e-NAM widens the buyer base. But it does not guarantee a buyer at a good price.

Perishability

- Perishable produce loses quality and value quickly after harvest.
- Fruits, vegetables and flowers spoil much faster than wheat and rice.
- A delayed sale can destroy the value of the whole crop within days.
- Fast transport and cold storage protect perishable produce on the way to buyers.
- A farmer growing a crop that spoils quickly must arrange fast transport or cold storage to sell in a distant city.

Storage and cold chain

- A cold chain keeps produce cool from the farm to the buyer.
- It includes cold storage rooms, refrigerated trucks and pack houses near the farm.
- Without proper storage, some farmers must sell quickly after harvest, when prices may be low.
- That forced sale at a low price is called a distress sale.

Processing and value addition

- Processing turns fresh produce into food that lasts many months.
- Examples are tomato paste, fruit juice and dried spices.
- Processing can raise farm income and reduce waste of a good harvest.
- It needs a reliable supply, money and a steady buyer for the finished product.

Access to credit

- High-value farming needs much more cash before harvest than cereal farming does.
- Timely credit decides whether a small farmer can afford all the inputs.

- The Kisan Credit Card (KCC) gives eligible farmers short-term bank credit for farm needs.
- Costly informal loans can swallow the extra income from a good crop.

Crop insurance

- The Pradhan Mantri Fasal Bima Yojana (PMFBY) is a government-run crop insurance scheme.
- It cushions farmers against weather losses such as drought, flood and excess rain.
- It covers notified crops against specified yield losses, not market-price falls.
- So PMFBY does not cover a price crash after a bumper harvest floods the market.
- Read more: Pradhan Mantri Fasal Bima Yojana (PMFBY).

Collective marketing and producer organisations

- A Farmer Producer Organisation (FPO) is a group farmers form to improve collective buying and selling.
- Members buy inputs and sell produce together as one group.
- The Small Farmers' Agribusiness Consortium (SFAC) promotes FPOs in many states.
- Group selling can improve small farmers' bargaining power with buyers.
- One farmer producer company used high-tech horticulture to grow flowers and vegetables.
- Read more: Farmer Producer Organisations (FPOs) and Collective-Action Farming Models.

Quick check 2. A farmer growing a quickly spoiling crop must arrange fast transport or cold storage to sell in a distant city. *(True or False?)* See answer ↓

Chapter 3: Support, Risk and Sustainability

Great to Know

Government support schemes

- The Mission for Integrated Development of Horticulture (MIDH) supports horticulture programmes run by state governments.
- Support goes to nurseries, polyhouses, drip systems and cold storage units.
- A polyhouse is a protected structure covered with plastic or shade net.

- Pradhan Mantri Kisan Samman Nidhi (PM-KISAN) gives direct income support to eligible landholding farmers.
- MIDH support and PM-KISAN payments can lower some costs or support eligible farmers.
- Neither programme guarantees a buyer, a market price or a profit.

MSP and high-value crops

- The Minimum Support Price (MSP) is a price announced by the central government for mandated crops.
- In 2026, the government announced MSP for 22 mandated crops, and a Fair and Remunerative Price for sugarcane.
- Wheat, rice and several pulses are among the crops with an MSP.
- Most fruits and vegetables have no MSP or announced floor price.
- Without a floor price, a bumper harvest can sharply cut market prices.
- Onion and tomato price crashes show how oversupply can reduce farmers' returns.
- Read more: Support Pricing System and MSP Mechanics.

Contract farming: what it can and cannot do

- Contract farming is a written agreement between a farmer and a buyer.
- The buyer is often a company, an exporter or a food processing firm.
- The agreement can set the quantity, the quality and sometimes the price.
- It does not always move market risk from the farmer to the buyer.
- A buyer may reject produce that fails the quality standards.
- The agreed price may be lower than that week's open-market price.
- So contract farming does not always give a fair price.

Quality, brands and exports

- Exporters and premium buyers pay more for properly graded and branded produce.
- A Geographical Indication (GI) tag protects a regional product name, such as Alphonso mango.
- India is a leading world producer of bananas, mangoes and spices.
- Export demand rewards quality. But it also demands strict food-safety and traceability rules.

Sustainability and diversified income

- High-value farming can use heavy water, fertiliser and pesticide on each hectare.
- Overuse harms the soil, local water and the long-term health of the farm.
- Diversified income means earning household income from more than one source.
- A mix of crops, livestock and off-farm work lowers total risk.
- Shifting too much land away from grains can affect national food output.
- Farm plans should balance income growth with local resources and food needs.

> **Quick check 3.** Subsidies and crop insurance together guarantee that a farmer can sell a high-value crop at a profit. *(True or False?)*
>
> See answer ↓

Quick check 4. Contract farming always moves market risk from the farmer to the buyer and always fixes a fair price. *(True or False?)* See answer ↓

Think it through: why does PMFBY not help when tomato prices crash?

Because PMFBY covers weather-linked yield loss. A price crash is a market loss, not a yield loss.

Chapter 4: Answer Writing

Great to Know

Model points for a 10-mark question

1. Start with returns: expected price, input cost and likely margin.
2. Add crop suitability: soil, water, climate and local agro-ecology.
3. Add market access: distance, transport, demand and the reach of e-NAM.
4. Add risk tools: timely credit, PMFBY insurance, storage and the cold chain.
5. Add collective action: FPOs, food processing and value addition.
6. Add policy support: MIDH and other horticulture schemes run with states.
7. End with the limits: weak MSP cover and volatile prices for fresh produce.

Quick questions

- **Why do many high-value crops carry more risk than wheat?** They are perishable, cost more to grow and mostly lack a support price.
- **Does crop insurance cover a price crash?** No. PMFBY covers weather yield loss, not a fall in market price.
- **What is the main benefit of an FPO?** Small farmers buy and sell together, which improves bargaining power.
- **Name factors guiding crop choice.** Price, input cost, water, distance, storage, credit and support.
- **Why does contract farming not always remove risk?** The buyer may reject the produce or offer a low price.

Quick Q&A

Horticulture share of farm GDP?

30.4%.

Horticulture beat foodgrain?

2012-13.

Does PMFBY cover price falls?

No.

MSP crops?

22.

What is a distress sale?

Forced low-price sale.

Practice MCQs

1. Which set of crops are correctly described as high-value crops?

A. Fodder crops grown mainly to feed dairy cattle

B. Only export crops like cotton and raw jute

C. Staple grains like wheat and rice grown for food security

D. Fruits, vegetables, flowers, spices and medicinal plants

See answer ↓

2. What is usually the first factor in a farmer's decision to grow a high-value crop?

A. The number of seeds available locally

B. The colour and taste of the crop

C. Expected profit per unit of land

D. The height of the plant at harvest

See answer ↓

3. Why do high-value crops carry more price risk than staple grains?

A. They are insured automatically against price fall

B. Most of them have no minimum support price floor

C. They always sell at government-fixed prices

D. They are bought by the Food Corporation of India

See answer ↓

4. How does contract farming help a farmer who grows high-value crops?

A. It fixes the price and the buyer before planting

B. It removes the need for irrigation

C. It replaces all farm labour with machines

D. It guarantees rainfall for the whole season

See answer ↓

Answer Key

1. **D.** High-value crops are horticultural crops such as fruits, vegetables, flowers, spices and medicinal plants. They yield much higher income per hectare than staple grains. Horticulture now brings about 30% of agricultural income from only about 13% of farm area. ↑ Q1
2. **C.** Expected returns per unit of land lead every crop decision. Farmers weigh the likely price against the cost of growing each crop. Higher profit pulls farmers toward high-value crops, while unstable prices push them back to staples. ↑ Q2
3. **B.** Minimum support price covers only about 22 crops, and most are staple grains. High-value crops mostly face free-market prices with no floor. A bumper harvest can crash prices, so farmers carry the full market risk. ↑ Q3
4. **A.**
   The answer is that contract farming fixes the price and the buyer before planting. The 2020 Act defined a farming agreement as a written agreement made before production. The sponsor agrees to buy the produce and to give farm services. The farmer keeps the land.
   ↑ Q4

Quick-check answers

1. **False.** ↑ 1
2. **True.** ↑ 2
3. **False.** ↑ 3
4. **False.** ↑ 4
